

MATH 2301

* Assignment 1 due tomorrow on Gradescope!

* Last time: Modular arithmetic

* Posets (preview)

** Def: A relation R on a set S is called a partial order if it is reflexive, anti-symmetric and transitive.

** Notation: Let R be a partial order on a set S .

① We'll say that S is a poset with respect to R .

② If $(a,b) \in R$, we'll say that $a \leq b$
If $a \leq b$ & $a \neq b$, we'll say $a < b$ or
 $a \nless b$

If $a \leq b$ then we can write $b \geq a$

** Examples [Check as an exercise]

① $\{(x,y) \in \mathbb{N} \times \mathbb{N} \mid x \leq y\}$

E.g. in this case $1 \leq 3$ because $1 \leq 3$.

② $\{(x,y) \in \mathbb{N} \times \mathbb{N} \mid x \geq y\}$

In this case, $3 \leq 1$ because $3 \geq 1$

③ S a fixed set.

$$\{(A,B) \in \mathcal{P}(S) \times \mathcal{P}(S) \mid A \subseteq B\}$$

E.g. $S = \{1, 2\}$: $\emptyset \preceq \{1\}$, $\emptyset \preceq \{2\}$, $\emptyset \preceq \{1, 2\}$
 $\{1\} \preceq \{1, 2\}$, $\{2\} \preceq \{1, 2\}$, $\{1\} \not\preceq \emptyset$, $\{1\} \preceq \{1\}$, etc.

④ $S = \{\text{sneezy, sleepy, happy, doc, grumpy, dopey, bashful}\}$

$$\{(w_1, w_2) \in S \times S \mid \text{length}(w_1) \leq \text{length}(w_2)$$

and w_1 is alphabetically $\leq w_2\}$

$\text{doc} \preceq \text{sneezy}$

sleepy & bashful are unrelated.

bashful is only related to itself

"a divides b"

$$\textcircled{5} \quad \{(a,b) \in \mathbb{N}_1 \times \mathbb{N}_1 \mid a \text{ is a factor of } b\}$$

↑
 not
 including zero

a | b

$2 \leq 22$ because $2 | 22$

$3 \leq 57$ because $3 | 57$

** Total orders

Let (P, \leq) be a poset. Then (P, \leq) is a total order if whenever $a, b \in P$, either $a \leq b$ or $b \leq a$.

[In this case, P is sometimes called a toset.]

*** Notation:

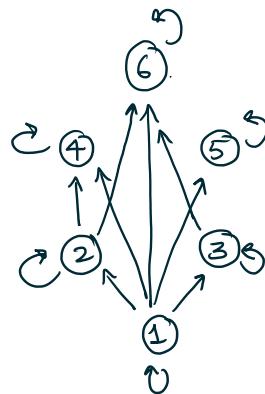

Let a, b be elements of a poset. We say that $a \& b$ are comparable if either $a \leq b$ or $b \leq a$. Otherwise they are incomparable.

** Hasse diagram

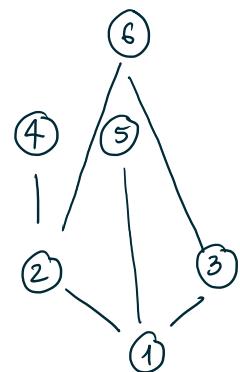

E.g. $S = \{1, 2, 3, 4, 5, 6\}$

$$R = \{(a, b) \in S \times S \mid a \text{ is a factor of } b\}$$

Graph

Hasse diagram

** Graph \rightarrow Hasse diagram?

- ① Delete self-loops
- ② Delete "shortcut" arrows (anything implied by transitivity)
- ③ All edges are assumed to be oriented upwards, and so we remove arrowheads.

** Hasse diagram → Graph drawing?

- ① Draw arrows (upwards)
- ② Fill in transitive arrows
- ③ Draw self-loops.

** Examples

① $S = \{1, 2, 3, 4\}$

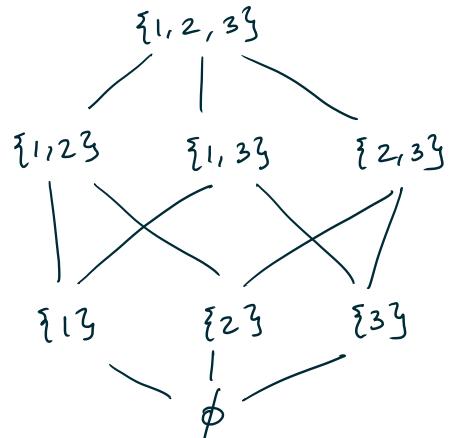

$$\{(a, b) \in S \times S \mid a \leq b\}$$

The Hasse diagram of a total order is a straight line

② $S = \{1, 2, 3\}$

$$\{(A, B) \in P(S) \times P(S) \mid A \subseteq B\}$$

** Topological sort

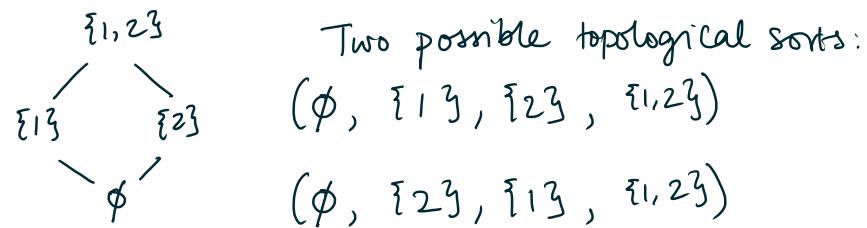

Let (P, \leq) be a finite poset.

A topological sorting of P is an ordering on all elements of P :

(p_1, p_2, \dots, p_n) , such that:

whenever $p_i \geq p_j$, we have $i \leq j$.

E.g. Subset poset of $\{1, 2\}$: $P = \{\emptyset, \{1\}, \{2\}, \{1, 2\}\}$

Theorem: Every finite poset has at least one topological sort.

Sketch of

Proof: Let (P, \leq) be a finite poset.

The first element of the ordering should be some $a \in P$ such that for any $b \in P$,

- either $a \leq b$, or

- a is not comparable with b .

} by finiteness

Once you have the first element, forget about it and do the same procedure to find the second el...
