

## MATH 2301

\* Assignment 5 will be posted by tomorrow & due next Friday.

\* Mid-semester class survey now open

### Möbius functions on product posets

Let  $\mu_1, \mu_2$  be the Möbius functions for  $P_1$  &  $P_2$ .

Let  $\mu$  = Möbius function for  $P_1 \times P_2$

\*\* Theorem : Let  $a, c \in P_1$  with  $a \leq_1 c$ . Let  $b, d \in P_2$  with  $b \leq_2 d$ . Then:

$$\mu([a,b], [c,d]) = \mu_1([a,c]) \cdot \mu_2([b,d]).$$

### Consequences

(1) If  $A$  is a set with  $n$  elements, the subset poset of  $A$  has the  $\mu$  function

$$\mu([\emptyset, X]) = (-1)^{|X|}$$

$\begin{matrix} (\{\}, \{2\}) \\ \uparrow \\ \{1, 2\} \\ \uparrow \\ \{1\} \end{matrix}$  can be written  
 as  $n$ -fold product  
 $\uparrow$  of  $i$   
 $\{1, 2, 3\}$   
 $\uparrow$   
 $\{1, 2\} \leftrightarrow (\{1\}, \{2\})$   
 $\uparrow$   
 $\{1, 3\}$   
 $\uparrow$   
 $\{1\} \leftrightarrow (\emptyset, \{1\})$

$$\mu([X, Y]) = (-1)^{|Y \setminus X|}$$

$\begin{matrix} \text{set minus = set} \\ \downarrow \\ \text{difference} \end{matrix}$

\* Every element of  $Y$  that's not in  $X$  contributes a  $(-1)$  to the product

(2) Let  $m = p_1^{a_1} p_2^{a_2} \cdots p_k^{a_k}$   
 $n = p_1^{b_1} p_2^{b_2} \cdots p_k^{b_k}$

$\left. \begin{array}{l} p_1 < p_2 < \cdots < p_k \text{ are} \\ \text{distinct primes} \\ a_i, b_i \geq 0 \text{ are integers} \end{array} \right\}$

such that  $m \mid n$ .

$$\begin{aligned} \underline{\text{Example}} : m &= 6 = 2^1 \cdot 3^1 = 2 \cdot 3 \cdot 5^0 \\ n &= 60 = 2^2 \cdot 3^1 \cdot 5^1 \end{aligned}$$

Observe that  $m \mid n$  means that  $a_i \leq b_i$  for each  $i$

$$\begin{aligned} \mu([m, n]) &= \mu([p_1^{a_1}, p_1^{b_1}]) \cdot \mu([p_2^{a_2}, p_2^{b_2}]) \cdots \\ &\quad \cdots \mu([p_k^{a_k}, p_k^{b_k}]) \end{aligned}$$

$$\underline{\text{Eg}} \quad \mu([6, 60]) = \mu([2^1, 2^2]) \cdot \mu([3^1, 3^2]) \cdot \mu([5^0, 5^1])$$

$$\begin{aligned} \mu([2, 2^2]) &= (-1)^2 \\ &= 1 \end{aligned} \quad \begin{aligned} \mu([3, 3^2]) &= 1 \\ &= 1 \end{aligned} \quad \begin{aligned} \mu([5, 5^1]) &= (-1)^5 \\ &= -1 \end{aligned}$$

$$\Rightarrow \mu([6, 60]) = 1.$$

In the general case, for every  $i$ , we'll have to compute  $\mu([p_i^{a_i}, p_i^{b_i}])$

$$\mu([p_i^{a_i}, -])$$

E.g.

①	$p_i^{b_i}$	④	$p_1^4$	⑥
②	$p_i^{b_{i-1}}$	③	$p_1^3$	⑦
⑤	$p_i^{a_i}$	⑧	$p_1^2$	⑨
⑩	$p_i^{a_{i+1}}$	⑪	$p_1^1$	⑫
⑭	$p_i^{a_i}$	⑬	1	⑮

(record the values in blue)

$$\Rightarrow \mu([p_i^{a_i}, p_i^{b_i}]) = \begin{cases} 1 & \text{if } b_i = a_i \\ (-1) & \text{if } b_i = a_{i+1} \\ 0 & \text{if } b_i > a_{i+1} \end{cases}$$

$$\mu([m, n]) = \mu([p_1^{a_1}, p_1^{b_1}]) \cdot \mu([p_2^{a_2}, p_2^{b_2}]) \cdots \cdots \mu([p_k^{a_k}, p_k^{b_k}])$$

$\Rightarrow$  This tells us a concise formula for  $\mu([m, n])$ .  
It depends on the divisors of  $(\mathbb{M}/m)$ .

E.g.  $\begin{cases} m=6 \\ n=60 \end{cases} \quad \mathbb{M}/m = 10 = 2 \times 5$

Theorem: Let  $m|n$ . The value of  $\mu([m, n])$  is:

$$\begin{cases} 0 & \text{if } \mathbb{M}/m \text{ is divisible by the square of a prime} \\ (-1)^e, & \text{where } e = \# \text{ distinct prime factors of } \mathbb{M}/m. \end{cases}$$

### \* Examples

- (1)  $\mu([6, 60]) = (-1)^2 = 1 \quad \text{or } 6/2 = 10 = 2 \times 5 \Rightarrow 2 \text{ distinct prime factors}$
- (2)  $\mu([1, 60]) = 0 \quad \text{or } 4 \mid 60, 4 \text{ is the square of a prime}$
- (3)  $\mu([2, 60]) = (-1)^3 = (-1) \quad \text{or } 60/2 = 30 = 2 \times 3 \times 5 \Rightarrow 3 \text{ distinct prime factors.}$

- (4)  $\mu([2, 36]) = 0 \quad \text{or } 36/2 = 18 \text{ is divisible by 9, which is the square of a prime.}$

\* One-sided convolution and matrices.

Fix a poset  $P$  and an ordering  $(a_1, \dots, a_n)$ .

Given  $f, g \in A(P)$ , we have  $n \times n$  matrices  $M_f, M_g$ , such that

$$(1) \quad M_{f+g} = M_f + M_g$$

$$(2) \quad M_{(f*g)} = M_f \cdot M_g.$$

Suppose  $p: P \rightarrow \mathbb{R}$ .

We can construct a vector  $\mathbf{v}_p =$

$$\begin{bmatrix} p(a_1) \\ p(a_2) \\ \vdots \\ p(a_n) \end{bmatrix} \quad \text{vector}^{n \times 1}$$

We can also construct  $\mathbf{v}_p^t = [p(a_1) \ p(a_2) \ \dots \ p(a_n)]$

\*\*Theorem: If  $f \in A(P)$ , and  $p: P \rightarrow \mathbb{R}$ , then:

$$(1) \quad \mathbf{v}_{(f*p)} = \underbrace{\mathbf{M}_f}_{\substack{n \times n}} \cdot \underbrace{\mathbf{v}_p}_{\substack{n \times 1}} \quad \left. \begin{array}{l} \text{one-sided} \\ \text{convolution} \\ \text{can be computed} \\ \text{using matrix} \\ \text{products.} \end{array} \right\}$$

$$(2) \quad \mathbf{v}_{(p*f)}^t = \underbrace{\mathbf{v}_p^t}_{\substack{1 \times n}} \cdot \underbrace{\mathbf{M}_f}_{\substack{n \times n}} \quad \left. \begin{array}{l} \text{one-sided} \\ \text{convolution} \\ \text{can be computed} \\ \text{using matrix} \\ \text{products.} \end{array} \right\}$$

\* The inclusion-exclusion principle

Q: How many positive integers from 1 to 100 are not divisible by 2, 3, or 5?

A: Step 0 : Remove all multiples of 2  $\leftarrow 50$   
 " " " " 34  $\leftarrow 33$   
 " " " " 5  $\leftarrow 20$

$$\text{Get } 100 - 50 - 33 - 20$$

$$= 100 - (103) = -3 \quad !!$$

[Because we double counted ...]

\*\* Inclusion-exclusion in terms of poset functions
